TUV NEL celebrated 30 years of its world leading Flow Measurement course with a record number of delegates from around the world

TUV NEL celebrated 30 years of its world-leading Flow Measurement course with the event's highest ever attendance of nearly 50 delegates, who came from around the world to train at the company's facility in East Kilbride.

Flow metering is essential for taxation and ownership of oil and gas, water supply and a wide range of other industrial processes.

This year's event was attended by delegates from Europe, North America, Asia and Africa.

"There are not many industrial courses which have continued to successfully attract international delegates for 30 years," says Bob Holmes, TUV NEL's Head of Business Development. "This year's record attendance indicates just how important flow monitoring is in today's globalised business environment and it highlights the world leading reputation TUV NEL has in this field."

The intensive three-day course is designed to train engineers on the latest flow metering methods and equipment. After completion of the course, delegates will be able to work confidently on systems which meter oil, gas and water across the globe.

The knowledge gained during the course is supplemented by real hands-on training, which allows delegates the opportunity to see how different flowmeters should be selected, calibrated, monitored and maintained.

"Flow measurement is vital to many industrial sectors from oil extraction and gas distribution through to water supply and process operations. It is essential that the correct accuracy of measurement is achieved and within stringent cost constraints," continues Bob. "There are a wide array of technologies and methodologies available to choose from, but after completing the Flow Measurement course delegates have a clear understanding of the correct technology to use in each situation."
